

# RPN PROJECT

## Already Existing Modules in Odoo

**There are several existing modules in Odoo that can help you achieve some of the functionalities you mentioned for your project. Here are a few modules that can be used or customized to meet your requirements:**

1. **Account Module (account):** Odoo's Account module provides features for managing accounts, transactions, and financial records. It can be used for the functionality of recharging member accounts and tracking account balances.
2. **Document Management System (DMS) Module (documents):** Odoo's DMS module allows users to store and manage documents. It can be used for adherents to upload their identification documents and view their historical records.
3. **Odoo Notifications Module (mail):** Odoo has a built-in notification system that can be utilized to send notifications to adherents and parents for various events, such as receiving a notification when an account recharge is completed.
4. **User Access Management (Base):** Odoo's built-in user access management system allows you to define different user roles and permissions. You can customize the access rights for adherents, parents, and the president role.
5. **Point of Sale (POS):** If you are planning to handle account recharge functionality in physical stores, you can integrate the POS module to facilitate the recharge process.

## Additional Functional in the Modules

**To achieve the remaining functionalities that are not covered by the existing Odoo modules, you would typically need to create custom models and modules. Here are the functionalities that would require custom model creation:**

- **For the "ADHERENT ENFANT" role:**

1. **Selectionne un gerant (Select a Manager):** If this involves assigning an "ADHERENT PARENT" user as a manager to an "ADHERENT ENFANT," you may need to create a custom model that establishes a relationship between the "ADHERENT ENFANT" and their manager (an "ADHERENT PARENT").
2. **Consulte son historique (View History):** This functionality may require creating a custom model to store and retrieve historical data related to actions taken by "ADHERENT ENFANT" users.
3. **Recharge son compte (Recharge Account):** While recharging an account could be handled by the existing accounting module, if you have specific rules or additional data associated with this process, you may need a custom model for this.

4. **Desactive son compte (Deactivate Account):** To deactivate an account, you might need a custom model that manages the account's status and related business rules.

- **For the "ADHERENT PARENT" role:**

1. **Cree des comptes enfant (Create Child Accounts):** This functionality would require a custom model to manage the relationship between "ADHERENT PARENT" and their associated "ADHERENT ENFANT" accounts.

2. **Consulte l'historique de ses comptes enfant (View Child Account History):** A custom model may be needed to store and retrieve historical data related to "ADHERENT ENFANT" accounts created by the parent.

3. **Recharge des comptes enfant (Recharge Child Accounts):** If specific rules or data need to be associated with recharging child accounts, a custom model could be required.

- **For the "PRESIDENT (RPN A)" role:**

1. **Cree un avis de deces (Create Death Notices):** Creating a custom model for managing death notices and their related data, such as deceased person's information and notifications, would be necessary.

2. **Consulte des soldes negatifs (View Negative Balances):** To manage and view negative balances, you may need a custom model that tracks account balances and their status.
